Going Digital: Why Use Industry Metadata Standards ... and How

Building an eXtensible Metadata Platform

Andrew Salop
Sr. Product Manager
Content Asset Management

www.adobe.com/products/xmp

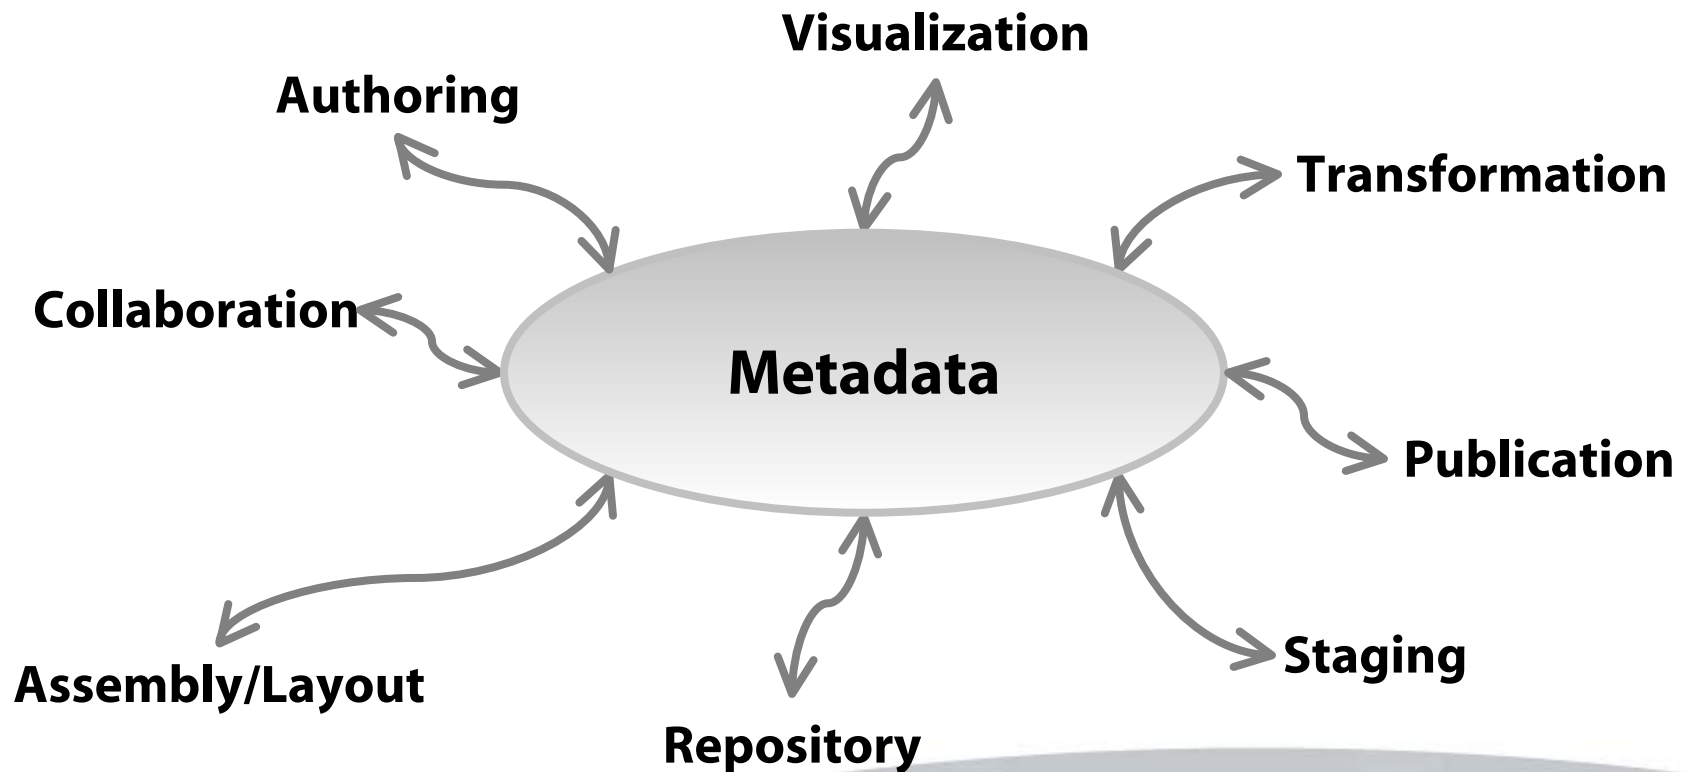

The Landscape: Network Publishing

- **The third revolution in publishing technology, after ...**
 - Desktop Publishing -1980s (digital production)
 - Web Publishing -1990s (mass-media digital publishing)
- **Making compelling content reliably available any time, anywhere, on any device**
 - Re-use, Re-purpose, Re-express
 - Print, Web, ePaper, handheld, broadcast, eBook, etc.)
 - Text, image, graphic, 3D, video, audio, animation, template
 - Files, objects, assets, documents, content, “data”
 - Individual and compound
- **Create, Manage, Deliver**

Network Publishing Ecosystem

Metadata interchange is fundamental to content management & Network Publishing

Metadata Describes Intent

- Data about data
- Not content
- Analogies
 - Label on a can
 - Annotations on pictures
 - Name tag

Metadata Categories

Implicit(generated) vs. Explicit(entered)

- **Identification**
 - Unique characteristics facilitating lookup and retrieval
 - title, creator, publisher, format
- **Discovery**
 - Searching, Querying, Categorization
 - subject, description, keywords
- **Rights**
 - Ownership, permission, access (copyright)
- **Relational**
 - Describes relationship with other elements (rendition of)
- **Temporal**
 - Parameters to judge relevance
 - creationTime, publicationTime, expirationTime
- **Structural**
 - Describes logical structure of content (headline, byline)

Metadata Dimensions

- **Schema**
 - Properties, vocabularies (controlled or otherwise)
 - Often provided through metadata standard bodies that address a particular domain
 - (defined by humans)
- **Encoding / Framework**
 - How metadata is expressed (XML, binary, etc.)
 - Usually through a defined format or in a database
 - How read and written by devices (SW&HW)
- **Logistics**

Metadata Logistics

- **Metadata in database with semantic link to separate file**

- May be separated
- "smart database, dumb file"

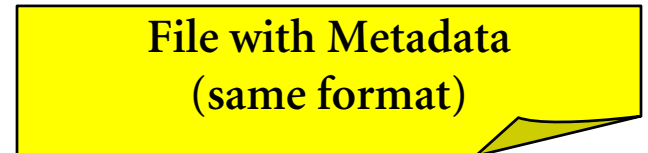

- **Separate Tag File, linked to content**

- Can also be separated

- **Incorporated into file format**

- File format may be difficult to read outside of authoring application

- **Embedded metadata format, within file format**

- Useful if metadata is encoded in open standard format (such as XML)
- "smart" file/asset/object/document

Metadata “Standard” Segmentation

Domain specific

- Library Science / Discovery
- Digital Photography
- News syndication
- Learning
- Video/broadcast
- eBook
- Magazine
- Enterprise / Proprietary
- ... others

*No common
encoding
mechanism*

Metadata Workflow Issues

- **Capture**
 - Accuracy, consistency
- **Compatibility**
 - Dropped or locked metadata
- **Overlapping vocabularies (schemas)**
 - Colliding properties (e.g., author, creator)
- **Reconciliation**
 - Updating to reflect a change in a file's status or characteristics
- **Interoperability**
 - Preservation & propagation across multiple file formats and databases
 - Translating industry specific terminology

Why Use Standards?

- **Schema**
 - Rather than building from scratch ...
 - leverage vocabularies that reflect prior thought,
 - then tweak to meet your needs
- **Encoding / Framework**
 - Think Network Publishing, i.e., multiple domains
 - Use an encoding mechanism that preserves and propagates metadata across multiple domains
- **Logistics**
 - Maintain linkage between data & metadata
 - Keep your assets “smart.”

Customer Requirements:

Open

Build on standards

Extensible

Support custom vocabularies

Universal

Support diverse file formats:
JPEG, GIF, TIFF, EPS, PDF,
HTML, XML, PNG, PSD ...

International

Unicode, multilingual

Robust

Keep metadata with asset

XMP

Award winning
file format neutral

extensible

metadata platform

MacWorld
Best of Show

Adobe and Metadata

- **XMP is Adobe's preferred metadata format**
 - Because it is extensible
 - Schema neutral (important for asset management)
 - File format neutral (important for workflows)
- **Integrating into Adobe software applications**
 - Common user experience across diverse tool & media types
 - Imaging, graphics, layout, ePaper, etc.
 - Easily supported by devices, software, formats, institutions
- **Co-exist with existing workflows**
 - Support for legacy standards
 - Common encoding specification

XMP Components

1. XML Packet

- Embeds XML within binary objects
- Accessible outside authoring application

2. Framework

- Based on W3C standard for XML Metadata (RDF)
- Supports aliasing of equivalent properties
- Works within and external to file formats

3. Schema (list of properties)

- Core (based on Dublin core)
- Extensible

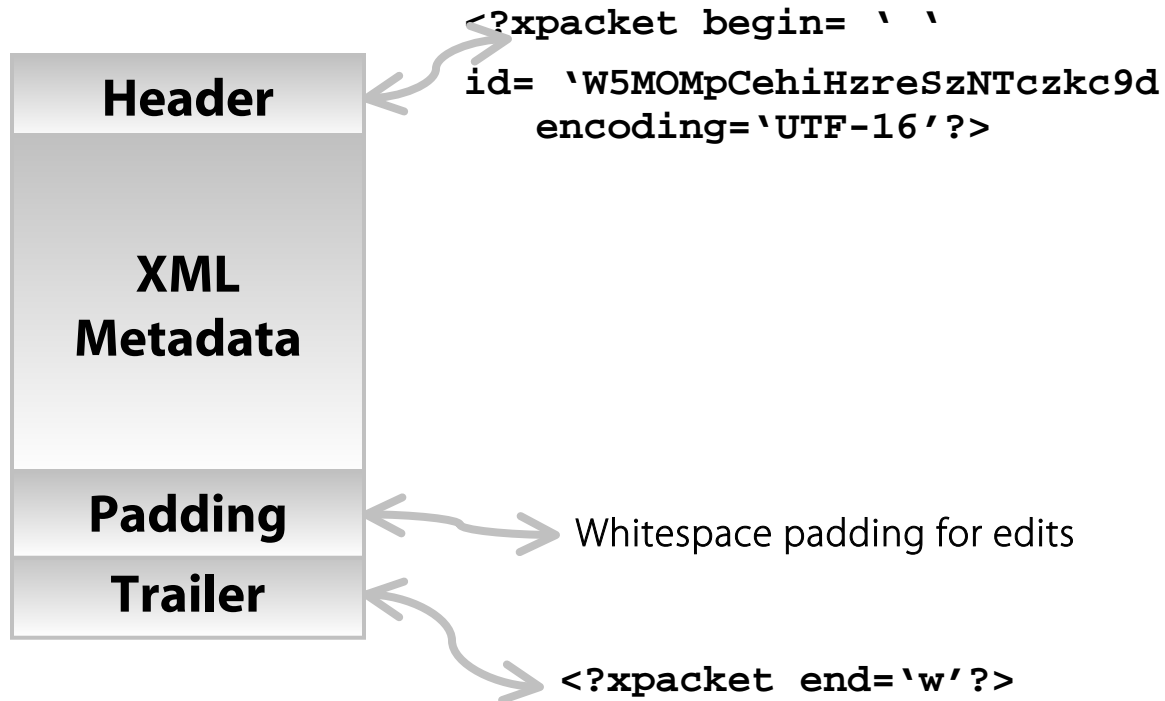

4. Software Developer Kit (SDK)

- Released September 2001
- Free download: (www.adobe.com/products/xmp)

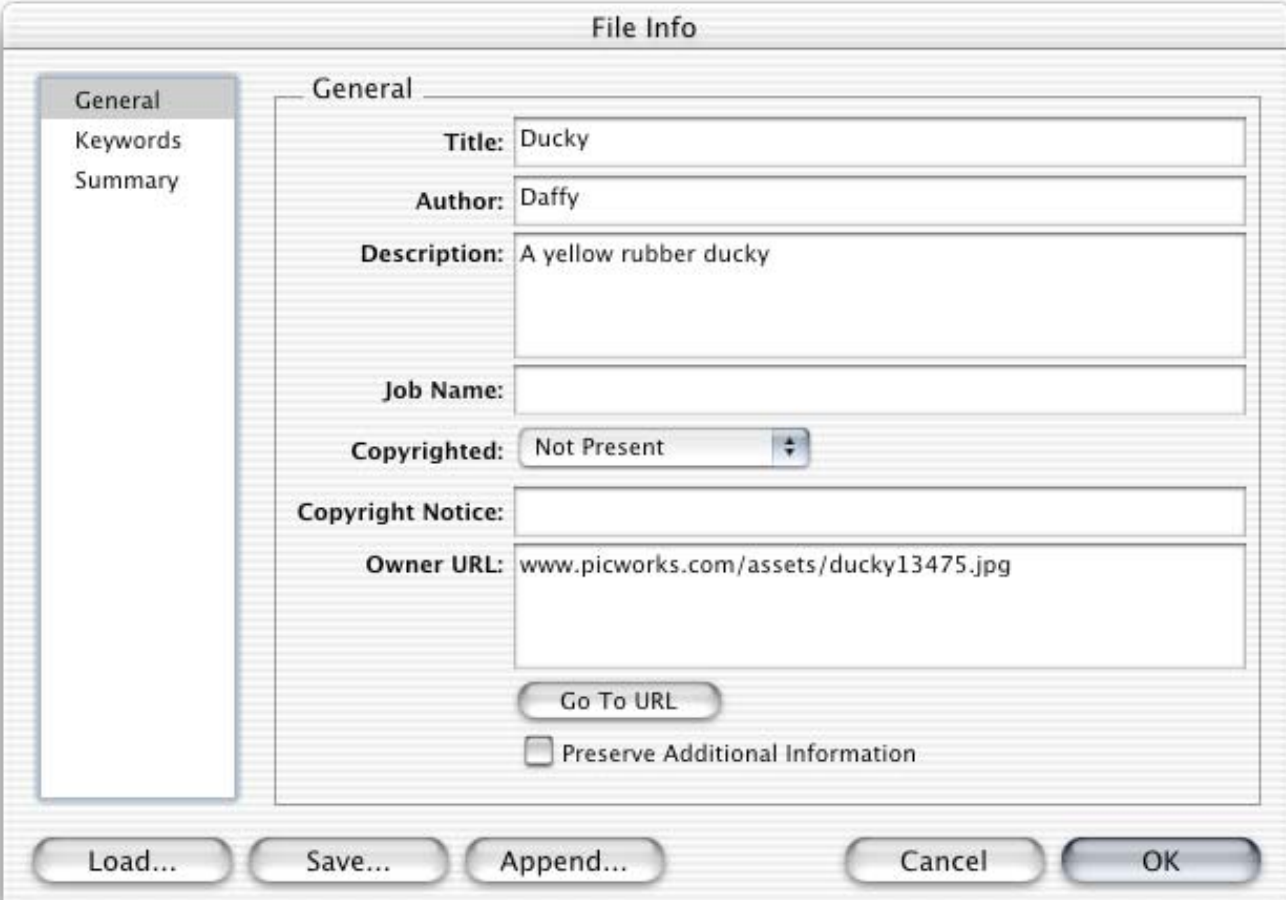

XML Packet

The secret to embedding XML in any file

Common implementation across Adobe applications

A screenshot of the 'File Info' dialog box in an Adobe application. The dialog has a title bar 'File Info'. On the left is a sidebar with three tabs: 'General' (selected), 'Keywords', and 'Summary'. The main area is titled 'General' and contains several fields: 'Title' with the value 'Ducky', 'Author' with 'Daffy', 'Description' with 'A yellow rubber ducky', 'Job Name' (empty), 'Copyrighted' with a dropdown menu showing 'Not Present', 'Copyright Notice' (empty), and 'Owner URL' with 'www.picworks.com/assets/ducky13475.jpg'. Below the 'Owner URL' field is a 'Go To URL' button and a checkbox labeled 'Preserve Additional Information' which is unchecked. At the bottom of the dialog are five buttons: 'Load...', 'Save...', 'Append...', 'Cancel', and 'OK'.

Industry Support

- Artesia
- Documentum
- Getty Images
- IBM
- Interwoven
- Kodak
- KPMG Consulting
- MediaBin
- North Plains Systems
- W3C
- WebWare
- Xerox

Benefits

- **Enables creation of “smart assets”**
 - promoting re-use, re-purposing & re-expression
- **Standardized tagging framework**
 - promotes metadata capture, preservation and propagation
 - across devices, software applications, file formats, institutions
 - works across network publishing workflows / create-manage-deliver
- **Extends metadata beyond the context of a database**
- **Embeds access to rights information**
 - Provides both absolute and relative references
- **XML metadata accessible without understanding host file format**
- **Open specification, based on industry standards**

XMP Resources

www.adobe.com/products/xmp

- Data sheet
- White Paper
- Online knowledgebase
- Software Development Kit (SDK)
 - Available via open source license
 - Contributors free to submit requests, bug fixes, suggest changes

“Of all the announcements, the one that’s least visible [XMP] is likely to have the biggest long-term impact ...

... Adobe is the first vendor to announce a framework for embedding metadata across multiple desktop applications, and XMP is sufficiently open and nonproprietary that it deserves consideration as an important new industry standard.”
